KM416V4000B, KM416V4100B   CMOS DRAM

4M x 16bit CMOS Dynamic RAM with Fast Page Mode

DESCRIPTION

This is a family of 4,194,304 x 16 bit Fast Page Mode CMOS DRAMs. Fast Page Mode offers high speed random access of memory cells within the same row. Refresh cycle(4K Ref. or 8K Ref.), access time (-45, -5 or -6), power consumption(Normal or Low power) are optional features of this family. All of this family have $\overline{CAS}$-before-$\overline{RAS}$ refresh, $\overline{RAS}$-only refresh and Hidden refresh capabilities. Furthermore, Self-refresh operation is available in L-version. This 4Mx16 Fast Page Mode DRAM family is fabricated using Samsung′s advanced CMOS process to realize high band-width, low power consumption and high reliability.

NOTES

1. An initial pause of 200§Å is required after power-up followed by any 8 $\overline{RAS}$-only refresh or $\overline{CAS}$-before-$\overline{RAS}$ refresh cycles before proper device operation is achieved.

2. V_{IH}(min) and V_{IL}(max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH}(min) and V_{IL}(max) and are assumed to be 5ns for all inputs.

3. Measured with a load equivalent to 1 TTL load and 100pF.

4. Operation within the t_{RCD}(max) limit insures that t_{RAC}(max) can be met, t_{RCD}(max) is specified as a reference point only.
   If t_{RCD} is greater than the specified t_{RCD}(max) limit, then access time is controlled exclusively by t_{CAC}.

5. Assumes that $t_{RCD} \geq t_{RCD}$(max).

6. t_{OFF}(min) and t_{OEZ}(max) define the time at which the output achieves the open circuit condition and are not referenced V_{oh} or V_{ol}.

7. t_{WCS}, t_{RWD}, t_{CWD} and t_{AWD} are non restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$(min), the cycle is an early write cycle and the data output will remain high impedance for the duration of the cycle. If $t_{CWD} \geq t_{CWD}$(min), $t_{RWD} \geq t_{RWD}$(min) and $t_{AWD} \geq t_{AWD}$(min), then the cycle is a read-modify-write cycle and the data output will contain the data read from the selected address. If neither of the above conditions is satisfied, the condition of the data out is indeterminate.

8. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.

9. These parameters are referenced to $\overline{CAS}$ falling edge in early write cycles and to $\overline{W}$ falling edge in read-modify-write cycles. Operation within the t_{RAD}(max) limit insures that t_{RAC}(max) can be met. t_{RAD}(max) is specified as a reference point only.

10. If t_{RAD} is greater than the specified t_{RAD}(max) limit, then access time is controlled by t_{AA}.
    These specifications are applied in the test mode.

11. In test mode read cycle, the value of t_{RAC}, t_{AA}, t_{CAC} is delayed by 2ns to 5ns for the specified values. These parameters

12. should be specified in test mode cycles by adding the above value to the specified value in this data sheet.

13. t$_{ASC}$, t$_{CAH}$ are referenced to the earlier $\overline{CAS}$ falling edge.

14. t$_{CP}$ is specified from the later $\overline{CAS}$ rising edge in the previous cycle to the earlier $\overline{CAS}$ falling edge in the next cycle.

15. t$_{CWD}$ is referenced to the later $\overline{CAS}$ falling edge at word read-modify-write cycle.

16. t$_{CWL}$ is specified from $\overline{W}$ falling edge to the earlier $\overline{CAS}$ rising edge.

17. t$_{CSR}$ is referenced to the earlier $\overline{CAS}$ falling edge before $\overline{RAS}$ transition low.

18. t$_{CHR}$ is referenced to the later $\overline{CAS}$ rising edge after $\overline{RAS}$ transition low.
19. t$_{DS}$ is specified for the earlier $\overline{CAS}$ falling edge and t$_{DH}$ is specified by the later $\overline{CAS}$ falling edge.
20. If t$_{RASS}\geq$100us, then $\overline{RAS}$ precharge time must use t$_{RPS}$ instead of t$_{RP}$.

21. For $\overline{RAS}$-only refresh and burst $\overline{CAS}$-before-$\overline{RAS}$ refresh mode, 4096(4K/8K) cycles of burst refresh must be executed within 64ms before and after self refresh, in order to meet refresh specification.

22. For distributed $\overline{CAS}$-before-$\overline{RAS}$ with 15.6us interval $\overline{CAS}$-before-$\overline{RAS}$ should be executed with in 15.6us immediately before and after self refresh in order to meet refresh specification.
